Thank you very much for including me in this important work and for the considerable thought that has gone into the analyses. One addition that could strengthen the clinical and policy interpretation would be to report net gains in survival—both all-cause deaths averted and life-years gained directly from the model. This seems particularly relevant because 22.8 million of the projected 30.5 million cardiovascular deaths averted occur at age 70 or older, and the statin analysis already illustrates how preventing deaths from one cause allows deaths from other causes to occur subsequently. Since the model incorporates other-cause mortality, could we report the difference in cumulative all-cause deaths and the additional person-years alive between the intervention and business-as-usual scenarios during 2026–2050? These measures would complement the current YLL estimates, which are calculated using external remaining life expectancy, and quantify the additional survival generated within the model itself. I think this would give the headline estimate considerably greater clinical meaning and make the prevention message even more informative.  Kind regards, Subodh

Dear Kouamivi,

Thank you once again for the opportunity to collaborate on this important and innovative work. Please find my comments attached.

Have a great weekend!

Best,
Bochen

**Subject:** Review of draft manuscript of paper 1_ writing group on hypertension control, WHO HEARTS, and cardiovascular health.

Dear Colleagues,

I hope you are doing well.
Thank you for agreeing to join this writing group.
Please find attached the draft of the first paper in the series, entitled ***"Closing the Treatment Gap: Projected Global Cardiovascular Health Gains from Expanding Blood Pressure Control and Statin Use Guided by WHO Commitments Across 186 Countries, 2026-2050: A Modelling Study."***

You are kindly invited to review the manuscript, including the main figures, tables, and supplementary materials, and provide your feedback **by COB on 21 October**. Should any substantial differences in opinion or divergent comments arise from the respective reviews, we will convene a final review meeting to discuss and resolve them.

Please also indicate your name and affiliation, as appropriate, by completing the information in parentheses next to your name (add your name if it's missing) on the first page of the manuscript. The order of co-authors will be determined at a later stage.

I look forward to receiving your comments and suggestions.

Kind regards,
Kouamivi

**Subject:** Invitation to join proposed Series writing group on hypertension control, WHO HEARTS, and cardiovascular health.

Dear Colleagues,

I hope you are well.
We are developing a proposal for a potential journal Series provisionally entitled ***"Controlling hypertension by 2030: evidence, implementation, and accountability for cardiovascular health"***, with the subtitle "*A WHO HEARTS 10-year Series*."

The proposed Series aims to bring together a set of complementary papers on hypertension control, integrated cardiovascular risk management, and WHO HEARTS implementation. The overall objective is to provide a rigorous and policy-relevant evidence base to support countries, funders, and implementation partners in accelerating progress towards improved hypertension control and reduced cardiovascular disease mortality by 2030 and beyond.

The Series would cover several linked areas, including: translating the 2030 target of 150 million additional people with controlled hypertension into national action; projected cardiovascular health gains from achieving WHO targets for hypertension control and lipid-lowering therapy; potential economic gains and return on investment; the burden attributable to hypercholesterolaemia and other modifiable cardiovascular risk factors; lessons from a decade of WHO HEARTS implementation; implementation models and health-system determinants of scale-up; equity and primary health-care strengthening; and unmet needs across the cardiovascular disease care continuum.

Given your expertise in these areas (hypertension / cardiovascular disease / implementation science / health economics / primary health care / global health policy), we would be honoured to invite you to join the proposed Series writing group. At this stage, we are seeking to confirm interest from a core group of colleagues before finalising the concept note, paper outlines, authorship structure, and approach to journal engagement.

Participation would involve contributing to the development of the Series concept, advising on the scope and scientific framing, and, depending on your interest and availability, contributing to one or more papers as a lead or co-author. We will aim to ensure that roles, expectations, timelines, and authorship are discussed transparently once the writing group is confirmed.

Please let us know whether you would be interested in being part of this proposed Series writing group. We would also welcome any initial reflections on the scope, proposed papers, or strategic positioning of the Series.

Thank you very much for considering this invitation. We would be delighted to have your expertise and leadership involved in shaping this work.

With best regards,
Kouamivi
